## Trimble Geomatics and Installation

Category:GIS softwareQ: Transformations of Templates I have the following 3 templates: 1) 2)

\$photo\_holder\_transformed[\$photo['size']][\$photo['filepath']][\$date'] 3)

\$full\_image\_transformed[\$image['filepath']][\$image['id']][\$pic\_path'] The common code for the 3 templates is a standard photo path: /\$full\_image\_transformed[\$image['filepath']][\$image['id']][\$pic\_path'] And what I'm trying to do is to make the data template dynamic and then pass it to the main template. In my understanding I would have to first store the transformed templates in a associative array and use them as a key. Something like:

\$data['main\_filepath']=\$full\_image\_transformed[\$image['filepath']][\$image['id']][\$pic\_path'] //in template #1, #2, and #3

\$full\_image\_transformed[\$data['main\_filepath']] Unfortunately, I get a broken coder expression error at this line. So what I'm asking here is: Am I correct to assume that I need to dynamically build up the line to transform a template or should I be building it up statically so as not to exhaust the array? A: OK, so I completely misread your question on this one. Your

\$data['main\_filepath'] is just a key that exists to access an item of a hash. The item it is accessing is the full\_image\_transformed[whatever\_filepath][whatever\_id][pic\_path]. The curly braces are just there to indicate that it is a piece of an array, and you can remove them. Putting this all together, you have something like: \$full\_image\_transformed = { ... };

\$data['main\_filepath']
